BeTrueCore — MVP Pilot Programme.
Sovereign Collective Decision-Making at Community Scale.

1. PILOT SELECTION CRITERIA.

The first pilot must simultaneously satisfy four conditions:

#	Condition	What it ensures
1	Real need — community already makes collective decisions and faces legitimacy or participation problems	Demand exists without artificial creation
2	Existing trust — participants already know each other (Web of Trust onboarding works organically)	L0 verification maps onto real social fabric
3	Neutral context — non-politically charged topic where «Infrastructure, Not Ideology» frame works without resistance	First proof is about the mechanism, not the outcome
4	Repeatability — not one session but a cycle (for VWU-history accumulation and demonstration of iterative character)	Proves the system, not a single vote

2. STRUCTURAL PROBLEMS THE PILOT PROVES.

Existing civic participation mechanisms are epistemically weak: petitions, surveys, and informal votes cannot prove authenticity or resistance to manipulation.

Current online polls suffer three structural failures:

Failure	Mechanism	BeTrueCore Response
Bot / SIM-card inflation	Local activists, developers, lobbyists purchase accounts to promote their interests	L0: NIN-code → ZK commitment → nullifier. DoubleRegisterFails test. One citizen = one key.
Fear of judgement	Participants avoid voting against initiatives of radical, active, or influential local groups	ZK-SNARKs + anti-collusion protocol (receipt-freeness): no one — not the Leader, not the administrator — can see how pan Novák voted
Distrust of results	Suspicion of result manipulation by IT departments of structural bodies	ZK proof of correctness published on-chain. Falsification is mathematically detectable.

3. HOW BETRUECORE WORKS IN THE PILOT.

3.1 Immune Island — Community Structure.

A closed pilot «digital island» (Immune Island) is launched for residents of one specific street, neighbourhood, or institution — 50–100 verified citizens — hereafter referred to as the «community», with its own «Leader».

Immune Island ≠ a closed forum. It is a cryptographically isolated environment where:

→ No participant can prove to an outsider how they voted (receipt-freeness)
→ No leader or administrator can access individual votes (ZK isolation)
→ No external actor can inject fictitious participants (L0 verification)
→ No result can be announced before 20:00 (time-lock, L3)

3.2 The Seven-Step Daily Cycle.

Step	Phase	Action
1	Prompt	Participant creates a prompt — a dilemma for the community
2–4	Prompt	Community votes for prompts submitted by participants
5–7	Dilemma	Binary choice on the TOP-3 Panorama dilemmas

Example dilemma:

«Should street X be closed to traffic on weekends to create a pedestrian zone?»

3.3 What Happens at 20:00 — The Panorama Effect.

At 20:00 the system releases the mathematically verified result (Panorama) simultaneously to all participants. No intermediate results are visible before this moment — informational isolation is total.

For the Participant	For the Community	For the Leader
Chooses Option A or Option B from a smartphone. No likes, no comments — no toxic disputes or bullying. The choice is cryptographically protected.	Receives a clean, manipulation-resistant citizen signal. VWU formula weights judgements by depth of contextual engagement — not by complaint frequency, but by participation history.	Zero legal liability for storing sensitive preferences. Cryptography protects the community itself from accusations of falsification.
In voting, the participant does not transfer the decision to a representative — they make it personally. Mathematical protection makes this assumption genuine and indisputable.	The result is not someone else's decision handed down from above. It is a collective choice for which every participant bears direct responsibility.	Eliminates accusations of manipulation: the decision was made by the community itself, is mathematically verified, and cannot be contested as 'imposed from above'.

4. VWU IN PILOT CONTEXT.

VWU (Verified Wisdom Unit) — the mechanism for extracting genuine preferences from the noise of coordinated behaviour.

Property	What it means for the Pilot
Non-linear growth	A bot completing all 7 steps daily accumulates weight slower than a real participant with variable, unpredictable engagement
Participation depth	Weight reflects how deeply a participant is embedded in the neighbourhood context — not how loudly they complain
Impossibility of instant accumulation	Weight is a function of time and quality. It cannot be purchased or created at the moment of a critical vote
Silence is sovereign	A participant who skips sessions does not lose their history. The system informs — it does not penalise

To simulate a high-weight community participant, the adversary must actually become one.

By the time an attacker accumulates enough VWU to influence the outcome — they have already become a genuine participant.

5. MEASURABLE OUTCOMES OF THE PILOT.

#	What the Pilot Proves	How it is measured	Layer
1	Unique citizen without identity disclosure	NIN-code → ZK commitment → nullifier; DoubleRegisterFails test	L0 → L1
2	Vote is non-purchasable	Key-rotation → receipt-freeness; NullifierPreventsDoubleVote test	L1 → L2
3	VWU weight works as a smart contract	Non-linear growth through regular participation. Missed sessions = missed growth. VWU_AbsenceDoesNotReduce test	L2
4	VWU result differs from simple majority	Manual pilot — three dilemmas — divergence documented	L2
5	Three primitives compatible in one chain	Integration test on testnet	L0 → L2

6. ECONOMIC ARGUMENT.

Criterion	Classical Survey	BeTrueCore Pilot Session
Cost	€2,000 – €15,000 per survey	Marginal infrastructure cost per session
Frequency	One-off or quarterly	Daily — continuous signal
Proof of authenticity	Statistical sampling (contestable)	Mathematical ZK proof (verifiable on-chain)
Manipulation resistance	Depends on agency independence	Architectural — encoded in protocol

Data liability	Stored centrally — legal risk for organiser	Zero — no sensitive data stored

The size of the community changes the volume of data — not the structure of measurement.

The matrix works identically with 50 participants and with 50,000. A pilot of 50 people is sufficient to prove this.

7. RESULT.

The pilot demonstrates the transition from an expensive, one-off «online vote» to a continuous, mathematically protected monitoring of real community needs.

MVP proves: sovereign collective decision-making technically exists — not as a concept, but as a verifiable smart contract on testnet.

→ Trial 1 (Pilot): human executes with mathematical support.
→ Trial 2: mathematics becomes the operator.
→ *Trial 3: community governs through the protocol itself.*
